

RIGOL

M300 Series Data Acquisition/ Switch System

- Up to 320 switch channels per mainframe, save on cost of ownership
- Can be run without PC
- USB logging
- Interval scanning with storage of up to 100,000 time-stamped readings
- 8 kinds of cards supported
- 6½ digits DMM can be enabled/disabled in any of slots
- Standard SCPI commands
- Math statistics: AVG, MAX, MIN, SDEV
- 4.3' TFT LCD
- Powerful PC software
- Full Interfaces supported: USB Device,USB Host, GPIB, LAN(LXI-Core 2011 Device), RS232

M300 Series Data Acquisition/Switch System with modular structure, which combines precision measurement capability with flexible signal connections, can provide versatile solutions for the applications with multiple points or signals to be tested in product performance test during R&D phase as well as automatic test during production process.

Multiplexers Selection Guide

M300 provides five kinds of multiplexers and five kinds of external terminal blocks which are used to connect signals. These multiplexers support three types of connection modes: 1-wire mode, 2-wire mode and 4-wire mode. You can select your desired multiplexer and terminal block by referring to the following table.

MC3120 20-Channel Multiplexer

- 20-channel multiplexer
- All 20 channels switch both HI and LO inputs
- The signal to be tested is connected through the M3TB20 terminal block
- Can be connected with MC3065

MC3132 32-Channel Multiplexer

- 32-channel multiplexer
- All 32 channels switch both HI and LO inputs
- The signal to be tested is connected through the M3TB32 terminal block
- Can be connected with MC3065

MC3132 32-Channel Multiplexer

- 32-channel multiplexer
- All 32 channels switch both HI and LO inputs
- Support 4-wire temperature sensor
- The signal to be tested is connected through the M3TB32T terminal block
- Can be connected with MC3065

MC3164 64-Channel Single-ended Multiplexer

- 64-channel single-ended multiplexer
- All 64 channels can switch HI input only
- The signal to be tested is connected through the M3TB64 terminal block
- Can be connected with MC3065

MC3324 20-voltage-channel+4-current-channel Mixed Multiplexer

- Mixed multiplexer with 20 voltage channels and 4 current channels
- All 20 voltage channels switch both HI and LO inputs
- 4 current channels are used to measure DC current or AC current
- The signal to be tested is connected through the M3TB24 terminal block
- Can be connected with MC3065

MC3416 16-channel Actuator

- 16-channel actuator
- Can connect signal to the device under test or enable external device
- Any of the 16 channels can switch to Normally-Open (NO) and Normally-Closed (NC) states
- The signal is connected through the M3TB16 terminal block

MC3534 Multifunction Module

- Multifunction module
- DIO: four 8-bit digital input/output ports
- TOT: four totalizer input terminals
- DAC: four analog output terminals
- The signal is connected through the M3TB34 terminal block

MC3648 4×8 Matrix Switch

- 4×8 two-wire matrix switch
- Used to connect multiple devices to multiple points on the device under test
- 32 two-wire cross points which can connect any combination of inputs and outputs at the same time
- The signal is connected through the M3TB48 terminal block

Measuring Characteristics

DC Voltage	
Input Impedance	200mV, 2V, 20V ranges: 10MΩ or >10GΩ (For these ranges, input beyond ± 26 V are clamped through 106 kΩ)
	200V and 300V ranges: 10MΩ±1%
Input Protection	300V
Input Offset Current	50pA, at 25°C, typical
CMRR (common mode rejection ratio)	140 dB for 1 kΩ unbalanced resistance in LO lead, ± 300 VDC peak maximum.
DC Current	
Shunt Resistor	100 Ω for 200 uA, 2 mA 1 Ω for 20 mA, 200 mA 0.1 Ω for 1 A
Auto Zero OFF Operation (typical value)	
Following instrument warm-up at the environment temperature $\pm 1^{\circ}\text{C}$ and <5 minutes, add 0.0001 % range + 2 uV error for DCV.	
Settling Considerations	
Reading settling times are affected by source impedance, cable dielectric characteristics and input signal changes. The default measurement delay can ensure the correctness of the first reading for most measurements.	
Measurement Considerations	
Teflon or other high-impedance, low-dielectric absorption wire insulation is recommended for these measurements.

NOTE: [1] Specifications are for 90-minute warm-up, slow ac filter and sine wave input.

[2] 10% overrange on all ranges.

[3] Relative to calibration standards.

[4] Specifications are for sine wave input >5% of range. For inputs from 1% to 5% of range and <50 kHz, add 0.1% of range additional error.
For 50 kHz to 100 kHz, add 0.13% of range.

[5] Specifications are for sine wave input >5% of range. For inputs from 1% to 5% of range, add 0.1% of range additional error.
Specifications are typical values for 200 uA, 2 mA and 1 A ranges when frequency is >1 kHz.

Measuring Characteristics

True RMS AC Voltage	
Measurement Method	AC-coupled True-RMS -- measure the ac component of input with up to 300 V DC bias on any range.
Crest Factor	≤ 5 at full range
Input Impedance	$1 M\Omega \pm 2\%$, in parallel with <150 pF capacitance on any range
Input Protection	300 V rms on all ranges
AC Filter Bandwidth	Slow: 3 Hz - 300 kHz Medium: 20 Hz - 300 kHz Fast: 200 Hz - 300 kHz
CMRR (common mode rejection ratio)	70 dB, for the 1 k Ω unbalance in LO lead, <60 Hz common mode signal frequency, ± 300 VDC peak maximum.
True RMS AC Current	
Measurement Method	Direct coupled to the fuse and shunt; AC-coupled True RMS measurement (measure the AC component).
Crest Factor	≤ 3 at full range
Max. Input	DC + AC current peak value <300% of range. Current with DC current component <1 A rms.
Shunt Resistor	100 Ω for 200 uA, 2 mA 1 Ω for 20 mA, 200 mA 0.1 Ω for 1 A

Settling Time Considerations

The default measurement delay of the multimeter can ensure the correctness of the first readings of most of the measurements. Make sure the RC circuit of input terminal has been fully settled (about 1 s) before accurate measurement.

Frequency and Period Characteristics

NOTE: [1] Specifications are for 90 minutes warm-up and 1 s gate time.

[2] For frequency ≤ 300 kHz, the specification is for AC input voltage of 10% to 110% of range. For frequency >300 kHz, the specification is for AC input voltage of 20% to 110% of range. The maximum input is limited to 750 Vrms or 8×10^7 Volts-Hz (whichever is less). 200 mV range is full range input or input that is larger than the full range.

For 20 mV to 200 mV inputs, multiply % of reading error by 10.

[3] Relative to calibration standards.

Measuring Characteristics

Frequency and Period	
Measurement Method	Reciprocal-counting technique, AC-coupled input using the AC voltage function.
Input Impedance	$1 M\Omega \pm 2\%$, in parallel with <150 pF capacitance on any range
Input Protection	300 Vrms on all ranges

Measurement Considerations

All frequency counters are susceptible to error when measuring low-voltage, low-frequency signals. Shielding inputs from external noise pickup is critical for minimizing measurement errors.

Settling Considerations

Errors will occur when attempting to measure the frequency or period of an input following a dc offset voltage change. The input blocking RC time constant must be allowed to fully settle (about 1 s) before the most accurate measurements are possible.

NOTE: [1] Specifications are for 90 minutes warm-up. Probe error excluded.

[2] Specification is for 4WR resistance measurement.

[3] Relative to cold junction temperature, accuracy is based on ITS-90. Built-in cold junction temperature refers to the temperature of the connector inside the terminal block and its accuracy is $\pm 2.5^{\circ}\text{C}$.

Measuring Characteristics

Thermocouple	
Conversion	ITS-90 software compensation
Reference Junction Type	Internal, Fixed, or External
T/C Check	Selectable per channel. When the channel resistance is $> 5\text{k}\Omega$, it is considered as Open.
RTD	
Alpha	= 0.00385 (DIN/IEC 751): using ITS-90 software compensation; = 0.00389, 0.00391 or 0.00392: using IPTS-68 software compensation
Thermistor	44004, 44007, 44006 series

Measurement Considerations

The built-in cold junction temperature tracks the temperature inside the terminal box. The change of temperature in the terminal box might cause additional error. When using the built-in cold junction compensation, connect the sensor terminal of the thermocouple to the terminal box and warm it up for more than 3 minutes to minimize the error.
